

Plastic-free Sakarun

Noplastic

Every piece of plastic ever produced is still present somewhere in the world. It often happens that we buy a certain item, we use it for a while, and soon throw it away.

But where is that "away"?

The situation is such that we are not aware of how this "away" became our sea...

Plastic is dangerous for marine life and humans:

- damages marine and coastal habitats
- enters the food web
- carries numerous toxins and pathogens with it
- enables the spread of invasive species
- not appealing to the eye - it has a negative impact on economic activities
- breaks down into microplastics and nanoplastics that can be found in honey, salt, sugar, beer, raindrops, snowflakes and air
- unknowing consumption leadt to intake of hormonal disruptors and potentially carcinogenic compounds
